multicolrule — Decorative rules between columns*

Karl Hagen[†]

Released 2018/12/31

Abstract

The multicolrule package lets you customize the appearance of the vertical rule that appears between columns of multicolumn text. It is primarily intended to work with the multicol package, hence its name, but it also supports the twocolumn option and \twocolumn macro provided by the standard classes (and related classes such as the KOMA-Script equivalents), as well as the bidi package (and through it, all RTL scripts loaded with polyglossia).

Index

1 Introduction

line-style=dashed

In LTEX, there are two lengths that control the formatting between columns of multicolumn text: \columnsep specifies the space between adjacent columns, and \columnseprule specifies the width of a solid vertical rule that is placed centered between the columns. The multicol package adds the ability to change the color of the rule, but in both vanilla LTEX and multicol, the rule itself is drawn directly inside the routines that output the column boxes, and is therefore difficult for users to alter.

Of course it's a legitimate question why anyone should *want* to change this rule, or indeed use one at all, as good typography tends to avoid using large vertical lines. In my own case, I needed to modify the rule because of the requirements of a particular style I was imitating, and having done the hard work of creating the necessary infrastructure for one

line style, it was simple to extend the solution to a more general case. I hope someone else will find the options here useful.

The basic line styles that multicolrule makes available are illustrated throughout this guide. The default line-width used is 0.4pt (thin), and the default color is Maroon. You can also find examples of rules created with all available options in the file mcrule-example.pdf.

New for Version 1.1

Version 1.1 now supports drawing decorative rules if you have the bidi package loaded, which can occur automatically if you set a right-to-left language with polyglossia. It also provides a mechanism to extend or shrink rules by fixed amounts, as well as to have the rule fill the available space to the end of the text area (see section 3.5).

1.1 Bugs and Known Limitations

line-style=dots

There are likely bugs that remain to be uncovered, as well as missing features and inefficient methods that should be improved upon. The development code is maintained on github (https://github.com/polysyllabic/multicolrule), and you can file feature requests or bug reports there. Alternatively, you can send an email to latex@polysyllabic.com. I welcome contributions for additional styles, especially to provide more options when running the package without tikz.

The line styles that work by repeating elements in a tiled pattern may have significant gaps at the end of columns, particularly for larger patterns. You can mitigate this problem slightly by tweaking the spaces above and below a pattern, but the basic problem is a side-effect of the way these patterns are implemented (with \cleaders), which means that only an integer number of copies can be produced. Lines drawn with tikz do not have this problem.

I have also noticed occasional instances, most noticeably when a multicols environment starts near the bottom of a page and the columns continue to the next one, where the rules are either somewhat shorter than they should be or shifted upward from where they belong. In the limited testing I have done, this appears to be a consequence of how multicol works, as the default rules show the same be-

 $^{^1\}mathrm{See},$ for example, the remarks in the documentation for the booktabs package

2 PACKAGE OPTIONS

havior. I may try to nail down this issue in future version, but as it's an edge case that disappears when you add page breaks or rewrite the text to alter how the columns are filled, it hasn't seemed worth taking the time to fix at this point.

This package works by patching the output routines of either multicol or the LETEX kernel, depending on the mode of operation. If bidi is loaded, it will also patch that. It will have no effect if you use a class or package that outputs column text via alternate mechanisms. This includes parcolumns, and probably other classes and packages designed

to typeset parallel-column text as well, although I have not done a survey to determine whether this is the case. If you would like support for one of these, please send me an email or file a feature request on github and I'll see what I can do.

3

multicolrule is written using expl3 syntax, and so requires a less-than-ancient installation of ETEX. It uses the packages l3keys2e, xparse, xpatch, and xcolor, and depending on the mode of operation may also require multicol and tikz. If you have an up-to-date distribution, these requirements should cause no issues.

1.2 License

line-style=dotted, width=ultra-thick

The multicolrule package is copyright 2018 by Karl Hagen. It may be distributed and/or modified under the conditions of the Lagarantee Public License, either version 1.3c of this license or (at your option) any later version.

The latest version of this license is in http://www.latex-project.org/lppl.txt.

This work has the LPPL maintenance status 'maintained.' The Current Maintainer of this work is Karl Hagen.

2 Package Options

2.1 Default Operation

line-style=dash-dot

If you load multicolrule with its default settings, it will enable multicol support, and that package will be loaded if it hasn't been already. Note that if you need to pass any parameters to multicol, such as docolaction, you should load multicol with the appropriate settings before you load multicolrule, as ETEX does not support reloading packages with different parameters.

2.2 Option 'twocolumn'

The multicolrule package recognizes the option twocolumn, either as a package option or as a global class option. If you pass this option to your document class, you do not need to pass it a second time to the package. It is only necessary to use the package option if you plan to have a predominantly one-column document and use \twocolumn to switch temporarily into two-column mode.

Because multicol does not work well with the ordinary two-column mode, multicolrule is only designed to work with one or the other at a time. If you try to use the twocolumn option when multicol has already been loaded, you will receive a warning, and nothing is guaranteed. But the custom rules will at best only appear in the conventional two-column mode and not within a multicols environment.

2.3 Option 'tikz'

You have access to a wider set of line styles if you also use the tikz package. Some line styles are only available if tikz is enabled, and others look better with it. The default behavior of multicolrule depends on the status of the tikz package at the time multicolrule is loaded. If multicolrule detects that tikz is already loaded, then tikz support will be enabled by default. Otherwise, you need the tikz to enable it. This option also ac-

cepts explicit boolean values, so you can pass tikz=false if you want to explicitly disable tikz support. If tikz support is not enabled (or if it is explicitly disabled), the line styles

marked *tikz only* in section 3.1 will be unavailable and errors will result if you try to use them.

3 The User Interface

line-style=circles,
width=2pt

The main user command for multicolrule is \SetMCRule. It takes one parameter containing a key-value list of all options you want to set. You can issue this command in the preamble or the document body. Changes to the rule settings are local to the current group. For example, if you call \SetMCRule inside a multicols environment, the rule settings will revert to their previous values once the environment ends. Also note that any changes made with \SetMCRule when

multiple columns are active will appear starting on the same page as your current location when you issue the command, and will extend the height of the full column box. It is not possible to have a rule change styles in the middle of a page unless you close out one multicols environment and begin another.

Table 1 summarizes the keys available in \SetMCRule. The functions of each is described in detail in the sections that follow.

Table 1: \SetMCRule keys

| Key | Purpose |
|-----------------|--|
| color | Set the color of the rule (see sec. 3.2) |
| color-model | Set the color model of the rule (see sec. 3.2) |
| custom-line | Set a custom tikz line for the rule (<i>tikz only</i> ; see sec. 3.1.2) |
| custom-pattern | Set a custom individual pattern for the rule (see sec. 3.1.2) |
| custom-tile | Set a custom tiling pattern for the rule (see sec. 3.1.2) |
| double | Draw two copies of the rule (see sec. 3.4) |
| extend-bot | Set an extra amount to extend the rule at the bottom of the |
| | column (see sec. 3.5) |
| extend-fill | Extend rule to the bottom of the text area (multicol only; see |
| | sec. 3.5) |
| extend-reserve | Space to reserve at bottom of text area when using |
| | extend-fill (multicol only; see sec, 3.5) |
| extend-top | Set an extra amount to extend the rule at the top of the column |
| | (see sec. 3.5) |
| line-style | Select the type of rule printed (default= <i>default</i> ; see sec. 3.1) |
| single | Draw a single copy of the rule (default; see sec. 3.4) |
| repeat | Set the number of times to draw the rule (see sec. 3.4) |
| repeat-distance | Set the horizontal space between adjacent copies of repeated |
| | rules (see sec. 3.4) |
| triple | Draw three copies of the rule (see sec. 3.4) |
| width | Set the width of the rule (see sec. 3.3) |

3.1 Styles with the 'line-style' option

You choose a style for the rule with the line-style key. If the predefined styles

• are insufficient, see section 3.1.2 for differ-

line-style=
solid-circles,
width=4pt

ent ways to customize it. The width of most line styles depends on the setting of \columnseprule, the default Lage length that controls the width of the column rule (see section 3.3).

Table 2 summarizes the available line

styles. Most of the basic patterns come in three versions, differing only in how closely the pattern is spaced: normal, dense, and loose. These settings parallel those found in tikz.

Table 2: Styles available for the line-style key

| Style | Description |
|----------------------|--|
| circles | A series of hollow circles (tikz only) |
| dash-dot | A dash followed by a square dot (tikz only) |
| dash-dot-dot | A dash followed by two square dots (tikz only) |
| dashed | A series of dashed lines |
| default | A solid rule drawn the same way as the default multicol rule. Does not support extended rules. |
| dense-circles | The same as circles but more closely spaced (tikz only) |
| dense-dots | The same as dots but more closely spaced |
| dense-solid-circles | The same as solid-circles but more closely spaced (tikz only) |
| densely-dash-dot | The same as dash-dot but more closely spaced (<i>tikz only</i>) |
| densely-dash-dot-dot | The same as dash-dot-dot but more closely spaced (tikz only) |
| densely-dashed | The same as dashed but more closely spaced |
| densely-dotted | The same as dotted but more closely spaced |
| dots | A series of dots drawn with the period (full-stop) of the current font |
| dotted | A series of square dots |
| loose-dots | The same as dots but spaced further apart |
| loose-circles | The same as circles but spaced further apart (tikz only) |
| loose-solid-circles | The same as solid-circles but spaced further apart (tikz only) |
| loosely-dash-dot | The same as dash-dot but spaced further apart (<i>tikz</i> only) |
| loosely-dash-dot-dot | The same as dash-dot-dot but spaced further apart (tikz only) |
| loosely-dashed | The same as dashed but spaced further apart |
| loosely-dotted | The same as dotted but spaced further apart |
| solid | A solid line, like default, but supports extending rules |
| solid-circles | A series of filled circles (<i>tikz only</i>) |

3.1.1 Notes on the Styles

The default and solid line styles are nearly the same, except that the solid line

(as of version 1.1) supports the rule-extension

commands described in section 3.5. This means that if you want a solid rule with altered top or bottom extensions, you must explicitly set the line style to solid. If you make no calls to \SetMCRule after loading multicolrule, the column divider will continue to behave exactly as it does with the ordinary multicol package.

You can alter the rule's width and color either through \SetMCRule with the width and color keys described in sections 3.3 and 3.2, respectively, or directly by changing the value of \columnseprule and renewing the \columnseprulecolor macro. All line styles, including default, can be repeated

as many times as you like (see section 3.4).

The dots style and its variants are rendered with a period (.) in the currently active font. This means that changing \columnseprule will not change the size of these dots, although, as with all rules, it will not appear at all if \columnseprule is set to 0pt. Custom tiles and patterns also do not scale with \columnseprule.

The dotted styles differ from dots in that the former are squares with side lengths equal to \columnseprule. This mirrors the behavior of the equivalently named dotted patterns in tikz.

3.1.2 Custom Patterns

 $custom-tile= \{\langle pattern \rangle\} \{\langle space \ above \rangle\} \{\langle space \ below \rangle\}$

custom-tile=
{\SparkleBold}
{16pt}{16pt}

There are three options to create custom rules with multicolrule. The first is the custom-tile key. This creates a rule consisting of vertically stacked boxes of arbitrary content—the tile—running the height of the column separator. The custom-tile key takes three parameters, which must all be enclosed brackets and may not be omitted. The first should contain the tokens you want to appear as the content of the tile. The second is a dimension specifying the leading vertical space to apply above each copy of the tile.

The third is a dimension specifying the trailing vertical space to insert below each copy of the tile.

The rule in this section uses the \SparkleBold symbol from bbding. Notice that when you use the custom-tile parameter, of any of the other custom key commands, you do *not* specify a separate line-style. If you try to provide both, the last style given in the list will be the one that is kept.

custom-pattern= $\{\langle pattern \rangle\}$ $\{\langle shift down \rangle\}$ $\{\langle shift up \rangle\}$

custom-pattern=
{\HandRight}
{0pt}{0pt}

The second custom option is with the custom-pattern key. The syntax is identical to that for custom-tile, but the content you specify will appear once per page or column pair (if the columns occupy less than a full page). This content will be vertically cen-

tered if the second and third parameters are both 0pt. You can shift the content down by increasing the second parameter, and up by increasing the third. The rule in this section uses the \HandRight symbol from bbding.

custom-line= $\{\langle draw \ command \rangle\}$

custom-line={
 \draw[line width=
 \columnseprule] (TOP)
to [ornament=88]
 (BOT);},
width=1pt

The third custom pattern involves setting your own tikz drawing function using the key custom-line. The rule in this section is drawn with an ornament from pgfornaments. Obviously, this feature requires tikz support. The value you provide to the

custom-line key should consist of a tikz command, such as \draw, without the surrounding tikzpicture environment.

Before the drawing command is called, multicolrule will set up a tikzpicture with both the x- and y-coordinates scaled to points,

and two nodes, named (TOP) and (BOT), which are set to the coordinates of the top and bottom of the rule. You can then specify your own \draw function in whatever way you like. The rule separating these columns was drawn with a decorative element from the pgfornaments package.

This function will use the color set in \columnseprulecolor if you don't set it

explicitly within the tikz command, but you must provide everything else necessary to draw the line correctly, including the line width. Note that this function should be considered experimental. It works for single-line commands such as the one shown in the example, but I haven't tested it with anything more elaborate.

3.2 Colors

line-style=solid,
width=2pt
color-model=cmy,
color={0.7,0.5,0.3}

You can set colors for the rule through the color and, optionally, the color-model keys. multicolrule loads the xcolor package to manage colors, and the color parameter accepts any name that xcolor recognizes, either natively or as the result of any names you have defined with \definecolor (see the xcolor documentation). Note that if you want to use color names that are defined through the one of xcolor's package options, you must load xcolor before both multicolrule and tikz with the relevant options.

To specify a color by a numeric specification, you use the color-model parameter to specify any color model that xcolor recognizes (rgb, cmy, etc), and color to hold the

color-specification list. Because that list is itself comma-separated, you must enclose it in brackets.

The current color setting can always be found in \columnseprulecolor. If you are running in twocolumn mode without multicol, this command will be provided and colors will work the same way they do with multicol. Note that setting the color key causes \columnseprulecolor to be redefined within the current group only. If you directly redefine \columnseprulecolor, the color of the custom rule will reflect this setting. This way, the settings of any packages that might alter the rule color will be respected.

3.3 Width

line-style=
dash-dot-dot,
width=thick

You can set the width of the rule with the width key. Legal values are any explicit dimension or dimension expression, as well as with names that parallel those used by tikz, except that spaces in the key names are replaced with hyphens.

The current width of the rule is kept in \columnseprule, just as in vanilla LaTeX, and if it is set separately, the custom rule's

width will reflect this change. Note that although some line styles do not depend directly on \columnseprule to calculate their actual width, the value of \columnseprule must be greater than 0pt for any rule to appear. This behavior is intentional and is in keeping with the way the default column rules work.

Table 3: Sizes of named line widths

| Name | Width | |
|------------|-------|--|
| ultra-thin | 0.1pt | |
| very-thin | 0.2pt | |
| thin | 0.4pt | |

Name Width

semithick 0.6pt
thick 0.8pt
very-thick 1.2pt

1.6pt

ultra-thick

Table 3: Sizes of named line widths (cont.)

3.4 Repeated Rules

line-style=
dash-dot-dot,
triple=2pt

You can draw multiple, adjacent copies of any rule by setting the number of times to draw the rule with the repeat key. The space between copies is controlled with the repeat-distance key. Initially, this distance is set to \columnseprule.

The keys single, double, and triple are shorthand methods to set the number of repeats and the repeat-distance at

the same time. If you use the key without a value repeat-distance is set to \columnseprule.

There are no checks made to ensure that repeated rules will fit in the available space between columns, so you should be careful using these commands, especially with thicker rules.

3.5 Extended Rules

line-style=dashed,
extend-top=-16pt,
extend-bot=-16pt

You can specify an additional amount by which the top or bottom of the rule projects beyond the column's natural length with the keys extend-top and extend-bot, each of which can be set to a dimension expression. Extending the top of the rule with a positive dimension will push the columns down from any preceding material. A positive value for extend-bot does the same in the other direction when a column ends in the middle of a page, but the rule will extend into the the bottom margin if the column goes to the end of the page, and so you probably only want to use this in very limited situations where you need a special effect for one column or a small multicol environment. Overprinting and other bizarre effects can result from extending the rule in the wrong place. Negative values for both keys may be more generally useful, as they have the effect of shrinking the rule. This behavior is illustrated with the rule for this section.

The extend-fill key is a boolean option that, when set to true, will extend the

rule to occupy any space between the bottom of the columns and the end of the text area. Providing the key with no value is equivalent to extend-fill=true. This option has no effect unless the multicol package is loaded.

If you want text below the multicols environment when using extend-fill, you can reserve space for it with extend-reserve, which takes a dimension expression specifying the vertical space to leave available after the rule. If the value is greater than zero, the height of the extended line will be reduced by the reserved amount plus the value of \multicolsep. In other words, you only have to specify the actual space you need for the text itself, not the space that multicol adds automatically below the columns. Note that if the amount you request for reserved space is less than the amount actually available at the end of the page, the rule will not extend below the columns and you probably will find this material spilling onto the next page anyway.

3.6 Rule Patterns

\DeclareMCRulePattern $\{\langle name \rangle\}\ \{\langle key\text{-}value\ list \rangle\}$

A "pattern" refers to a bundle of settings used by multicolrule. You can declare a pattern for a line style with the command \DeclareMCRulePattern. The $\langle name \rangle$ should consist of letters and hyphens only. The \(\langle key-value \ list \rangle \ \text{can} \ \mathbb{\text{\$\infty}\$} contain all keys that are valid for \SetMCRule with the exception of patterns. If you put something like patterns=foo in the definition of a pattern, you won't get an error, but it will be ignored.

Once you have declared a pattern, you can use it as a value for the patterns argument of \SetMCRule. This key can accept either a single pattern or a comma-separated list of patterns. If you use a comma-separated list, make sure you enclose it in braces.

When a pattern is in effect, its settings are applied on top of whatever the prior settings are. If you set the key to an empty list, any patterns currently in effect will be canceled, and multicolrule will revert to the previous settings.

If the patterns key contains more than one pattern, multicolrule will cycle 😭 through the list of patterns, using one pattern each time a rule is drawn between columns. (Note, the patterns do not cycle within a single column separator if you use the repeat key.) This cycle is global, so if the number columns is not a multiple of the number of patterns and you start a new multicols environment with the same patterns in effect, the cycle will pick up where it left off. Every time you set new patternss, however, the cycle begins anew.

If you want to alter the rule only for certain column separators, you can use the pattern-after and

pattern-for keys, both of which take integer values, in conjunction with patterns.

The pattern-for key means "use the given pattern or patterns for this many column separators only." Afterwards, the pattern will be disabled, meaning that it won't be applied any more and only the settings applied directly will be in effect until it is reset. A negative value to this key means that the patterns will be repeated indefinitely. The default is -1.

The pattern-after key means "wait until after this many column separators before starting to apply the pattern. The default is 0. If you use it in conjunction with pattern-for, the count of modified column separators begins after the skipped columns.

```
DeclareMCRulePattern {foo} {some keys\dots}
begin{multicols}{4}
  \SetMCRule{patterns=foo, pattern-after=2, pattern-for=1}
Your text...
end{multicols}
```

For example, suppose you have four-column text and want to alter the third column separator on the first page of the environment only.² You could accomplish this task with the code above.

Using predefined pat-

terns adds processing overhead, since they must be applied each time the rule is drawn. Therefore it is more efficient to avoid patterns unless you need to actually change the line style from column to column.

Note that any settings

you provide in the same command where you apply a patterns key do not alter definition of the pattern. If you do this, you are altering the settings in effect before the pattern is applied.

²Remember that you have one less column separator than you have columns.

4.2 Patching Output Routines

__mcrule_column_height: __mcrule_column_depth:

Get the height and depth of the box appropriate to the supported mode.

```
46 \cs_new:Npn \__mcrule_column_height: {}
47 \cs_new:Npn \__mcrule_column_depth: {}
```

Now that we know what mode we're going to run in, we patch the output routine(s) to substitute our custom rule for the vanilla one. Since multicol doesn't fully support twocolumn mode, we patch one or the other, but not both. As of version 1.2, we make \columnseprulecolor part of \mcruledivider so that we can set the color as part of a style pattern.

__mcrule_patch_mcol_output:N

__mcrule_patch_twocol_output:N

```
55 \cs new protected:Npn \ mcrule patch twocol output:N #1
56 {
    \xpatchcmd{#1} {\normalcolor\vrule\@width\columnseprule}
57
    {\mcruledivider}
    {\msg_info:nnn {multicolrule} {patch-success} {#1}}
    {\msg_info:nnn {multicolrule} {patch-failure} {#1}}
61 }
62 \bool_if:NTF \g__mcrule_twocolumn_bool
63 {
    \@ifpackageloaded{multicol}
64
    {\msg_warning:nn {multicolrule} {multicol-loaded}}{}
65
Provide the column-color macro from multicol.
    \cs_gset:Npn \columnseprulecolor {\normalcolor}
    \cs_gset:Npn \__mcrule_column_height: {\box_ht:N \@outputbox}
    \cs_gset:Npn \__mcrule_column_depth: {\box_dp:N \@outputbox}
    \__mcrule_patch_twocol_output:N \@outputdblcol
```

Now patch the relevant code in \@outputdblcol, replacing the hard-coded rule with a macro that we can overwrite.

```
\__mcrule_patch_twocol_output:N \@outputdblcol
```

bidi has two output routines to patch, and it insists on being loaded after xcolor, tikz, and multicol, so it must always be loaded after us. We use \AfterPackage from scrlfile to insert the patch if bidi is loaded later on.

Although taking the height of <text> is a reliable way to get the column height, the same isn't true for the depth, so we use $\dim v$, which multicol uses to hold the maximum depth of all the columns, instead.

```
\cs_gset:Npn \__mcrule_column_height: {\box_ht:N \mult@rightbox}
\cs_gset:Npn \__mcrule_column_depth: {\dimen\tw@}
```

We need to reissue \LRmulticolcolumns to update the actual code in \mc@align@columns.

```
83 \LRmulticolcolumns
```

The bidi package supplies its own versions of most core multicol functions, including the output boxes. Much of this is unnecessary, as current versions of multicol support printing the columns in right-to-left order, and the effect is to leave the original multicol definitions loaded but unused. As a result, after these changes, the multicol commands \LRmulticolcolumns and

\RLmulticolcolumns have no visible effect. But as bidi also reworks the footnotes extensively, it's easier just to patch the equivalent output routines rather than rewrite it properly.

```
84  \AfterPackage!{bidi}
85  {
86    \cs_gset_eq:NN \LTR@column@boxes \LR@column@boxes
87    \cs_gset_eq:NN \RTL@column@boxes \RL@column@boxes
```

While we're at it, we also redefine \LRmulticolcolumns and \RLmulticolcolumns so they work the way people expect them to.

```
\cs_gset_eq:NN \LRmulticolcolumns \LTRmulticolcolumns
\cs_gset_eq:NN \RLmulticolcolumns \RTLmulticolcolumns
\]
\[
\sqrt{91}\]
\]
\[
\text{S} \\
\text{S} \\
\text{S} \\
\text{S} \\
\text{RTLmulticolcolumns} \\
\text{RTLmulticolcolumns} \\
\text{S} \\
\te
```

4.3 Creating the Rules

Utility functions for different rule types

\mcruledivider

This is the function directly called by the patched output routines. It has a LTEX2 name so the user can redefine it if necessary. Its main function is to call the internal function __-mcrule_divider:, which contains the actual rule-typesetting instructions, the number of times specified in \l__mcrule_repeat_int. multicol puts the rule in a group in order to keep the color contained, which means that any local changes here will be lost at the end of the rule. For this reason, we must set the pattern, if any, here in order to support having different line styles between different columns.

```
92 \cs_new_protected:Npn \mcruledivider
93 {
```

If the pattern-after counter is set, wait that many iterations of the rule before we apply the patterns.

```
% \int_compare:nNnTF {\g__mcrule_pattern_after_int} > {\c_zero_int}
% {
% \int_gdecr:N \g__mcrule_pattern_after_int
% }
% }
% }
```

Don't change if the pattern is empty or the pattern-for counter has expired. The way the logic works here, negative values of pattern-for result in an indefinite number of repeats.

```
\bool lazy and:nnT
     {\int_compare_p:nNn {\seq_count:N \l__mcrule_pattern_list_seq} > {\c_zero_int}}}
100
       {! \int_compare_p:nNn {\g__mcrule_pattern_for_int} = {\c_zero_int}}
101
102
         \int_gincr:N \g__mcrule_pattern_count_int
103
         \int_compare:nNnT {\g_mcrule_pattern_count_int} >
          {\seq_count:N \l__mcrule_pattern_list_seq}
           \int_gset:Nn \g__mcrule_pattern_count_int {\c_one_int}
107
108
       \tl_set:Nx \l_tmpa_tl {\seq_item:Nn \l__mcrule_pattern_list_seq {\g__mcrule_pattern_cou
109
         \tl_if_blank:VF \l_tmpa_tl
110
         {
           \_{mcrule\_set\_pattern:V \l_tmpa\_tl}
        }
```

Now that the pattern has been changed we can set the color.

columnseprulecolor

We only call $_$ _mcrule_divider: if $\$ columnseprule > 0, so that all line styles can be turned off by setting it to 0, just as is the case with the vanilla rules.

```
\bool_lazy_and:nnT
     {\dim_compare_p:nNn {\columnseprule} > {\c_zero_dim}}
123
    {\int_compare_p:nNn {\l__mcrule_repeat_int} > {\c_zero_int}}}
124
       \__mcrule_divider:
       \prg_replicate:nn {\l__mcrule_repeat_int - \c_one_int}
127
         \hspace{\l__mcrule_repeat_distance_dim}
128
         \__mcrule_divider:
129
      }
130
131
    }
```

(End definition for \mcruledivider. This function is documented on page ??.)

__mcrule_column_total_height:
__mcrule_column_total_depth:

Get column height and depth with any explicit alterations.

```
133 \cs_new:Npn \__mcrule_column_total_height:
134 {
135     \dim_eval:n {\__mcrule_column_height: + \__mcrule_column_depth: +
136     \__mcrule_extend_column_top: + \__mcrule_extend_column_bottom:}
137 }
138 \cs_new:Npn \__mcrule_column_total_depth:
139 {
140     \dim_eval:n {\__mcrule_column_depth: + \__mcrule_extend_column_bottom:}
141 }
```

mcrule extend column top:

Currently, the extend amount for the top is just the $\1_@@_extend_top_dim$ distance. In the future we may allow more complex criteria, such as by odd or even page, or on a particular page. Although these might theoretically be useful, I'm not going to implement them until someone comes along with a use-case for it.

```
142 \cs_new:Npn \__mcrule_extend_column_top:
143 {
144 \l__mcrule_extend_top_dim
145 }
```

__mcrule_extend_column_bottom:

The extend-fill option, which is only applicable with multicol, extends the rule from the bottom of the column to the end of the text area, minus whatever reserved space the user specifies. If there's less space available than requested, we give everything we can.

```
146 \cs_new:Npn \__mcrule_extend_column_bottom:
147 {
148
     \bool_lazy_and:nnTF
     \{\bool_if_p:n\ \{\l_mcrule_extend_fill_bool\}\}
149
     {\bool_not_p:n {\g__mcrule_twocolumn_bool}}
150
151
       \dim compare:nNnTF
152
     {\@colroom - \_mcrule_column_height: - \_mcrule_extend_reserve:} > {\c_zero_dim}
153
       {\@colroom - \__mcrule_column_height: - \__mcrule_extend_reserve:}
154
       {\c_zero_dim}
155
156
157
     {\lower \{ \lower le_extend\_bot\_dim \}}
158 }
```

mcrule extend reserve:

The reserved space is the amount of user-provided space we want, but we also have to account for the space added with \multicolsep.

```
159 \cs_new:Npn \__mcrule_extend_reserve:
160 {
161    \dim_compare:nNnTF {\l__mcrule_extend_reserve_dim} > {\c_zero_dim}
162    {\dim_eval:n {\l__mcrule_extend_reserve_dim + \multicolsep}}
163    {\c_zero_dim}
164 }
```

mcrule divider:

This is the internal routine that contains the instructions to draw one copy of rule between columns. The default is identical to the original definition used by multicol. It will be reset each time the user calls \MCSetRule to specify a new line style.

```
165 \cs_new:Npn \__mcrule_divider: {\vrule\@width\columnseprule}
```

__mcrule_pattern:nnn

```
\verb|\coloredge | -mcrule_pattern:nnn | {\langle pattern \rangle} | {\langle space | above \rangle} | {\langle space | below \rangle} |
```

Typesets a single copy of a pattern, vertically centered, in a vertical box that is the height of the current column. The pattern must be something that can go in a horizontal box. The spaces above and below must be fixed dimensions.

```
\cline{1.5} \cli
```

Typesets multiple copies of pattern, tiled so as to occupy a vertical box that is the height of the current column. The pattern must be something that can go in a horizontal box. The spaces above and below must be fixed dimensions.

```
\cs_new_nopar:Npn \__mcrule_tile_pattern:nnn #1#2#3
179 {
180
     \box_move_down:nn {\__mcrule_column_total_depth:}
181
       \vbox_to_ht:nn {\__mcrule_column_total_height:}
182
183
         \tex_cleaders:D \vbox:n
184
185
            \tex_kern:D #2 \hbox:n{#1} \tex_kern:D #3
186
         }
187
       \tex_vfill:D
188
       }
189
190
    }
191 }
```

This function can draw a line pattern using either a tikz name or directly (as a tiled pattern). The latter case is currently limited to line patterns that can be described in terms of a solid line of length $\langle height \rangle$ separated by spaces above and/or below the line.

_mcrule_solid_line:

Unlike the default solid line, which is created with a simple \vrule, this version allows us to extend the line beyond the natural space of the column.

```
202 \cs_new:Npn \__mcrule_solid_line:
203 {
204 \rule[-\__mcrule_column_total_depth:]{\columnseprule}{\__mcrule_column_total_height:}
205 }
```

4.3.1 Tikz-only Routines

If we're supporting tikz, make sure it's loaded and redefine the relevant functions. We turn off expl3 syntax to load the package because tikz relies on 2e catcodes, especially for spaces.

```
206 \bool_if:NTF \g__mcrule_use_tikz_bool
207 {
208 \ExplSyntaxOff
209 \RequirePackage{tikz}
```

210 \ExplSyntaxOn

__mcrule_tikz_picture:n

```
\mbox{\ \ } \mbox{\ \ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ \ \ } \mbox{\ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ } \mbox{\ \ \ \ \ } \mbox{\ \ \ } \mbox{\ \ \ } \mbox{\ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ } \mbox{\ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ \ \ } \mbox{\ \ \ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \ \ } \mbox{\ \ \
```

Set up the tikzpicture environment and declare two nodes, named (TOP) and (BOT). This way we can pass a \draw routine directly, without worrying about the line's coordinates.

```
211 \cs_set:Npn \__mcrule_tikz_picture:n #1
212 {
213    \begin{tikzpicture}[x=1pt,y=1pt,inner~sep=0pt,outer~sep=0pt,
214     baseline={([yshift=\__mcrule_column_total_depth:]current~bounding~box.south)}]
215    \node (TOP) at (0,\__mcrule_column_total_height:) {};
216    \node (BOT) at (0,0) {};
217    #1
218    \end{tikzpicture}
219 }
```

__mcrule_pattern_line:n

```
\__mcrule_pattern_line:n \{\langle tikz \ pattern \rangle\}
```

For the tikz versions of the predefined lines, we just draw a line the length of the column box. $\langle tikz \ pattern \rangle$ should contain the name of a line style that tikz recognizes.

```
220 \cs_set:Npn \__mcrule_pattern_line:n #1
221 {
222  \begin{tikzpicture}[x=1pt,y=1pt,inner~sep=0pt,outer~sep=0pt,
223  baseline={([yshift=\__mcrule_column_total_depth:]current~bounding~box.south)}]
224  \draw[line~width=\columnseprule,#1] (0,\__mcrule_column_total_height:) -- (0,0);
225  \end{tikzpicture}
226 }
```

__mcrule_circle:

Draw a hollow circle with a diameter equal to \columnseprule. This will be used as a tile pattern.

```
227 \cs_set:Npn \__mcrule_circle:
228 {
229 \begin{tikzpicture}[x=1pt,y=1pt,inner~sep=0pt,outer~sep=0pt]
230 \draw (0,0) circle[radius=.5\columnseprule];
231 \end{tikzpicture}
232 }
```

__mcrule_solid_circle:

Draw a filled circle with a diameter equal to \columnseprule. This will be used as a tile pattern.

```
233 \cs_set:Npn \__mcrule_solid_circle:
234 {
235 \begin{tikzpicture}[x=1pt,y=1pt,inner~sep=0pt,outer~sep=0pt]
236 \fill (0,0) circle[radius=.5\columnseprule];
237 \end{tikzpicture}
238 }
239 }
```

In case tikz functions are not active, we provide stubs that issue error messages.

```
<sup>240</sup> {
<sub>241</sub> \cs_set:Npn \__mcrule_tikz_picture:n #1
```

4.4 Color

__mcrule_set_rule_color:

Reset color definition in \columnseprulecolor by name or by model and color specification.

```
250 \cs_new_protected:Npn \__mcrule_set_rule_color:
     \tl_if_empty:NT \l__mcrule_color_name_tl
252
253
     {
       \tl_set:Nn \l__mcrule_color_name_tl {black}
254
255
     \tl_if_empty:NTF \l__mcrule_color_model_tl
256
257
     {
       \cs_set:Npn \columnseprulecolor {\color{\l__mcrule_color_name_tl}}
258
259
     }
260
     {
       \cs_set:Npn \columnseprulecolor
       \label{lem:color_model_tl} $$ \color[\l_mcrule_color_model_tl]_{\l_mcrule_color_name_tl}$$
263
     }
264 }
```

4.5 Patterns

__mcrule_set_pattern_list:n

Sets a comma-separated list of patternss as a sequence for later use. The global counter that indicates where we are in the list is also reset here, so setting a list of patterns always means that the next rule will use the first pattern in the list.

```
265 \cs_new_protected:Npn \__mcrule_set_pattern_list:n #1
266 {
267   \seq_set_split:Nnn \l__mcrule_pattern_list_seq {,} {#1}
268   \int_gzero:N \g__mcrule_pattern_count_int
269   \int_gzero:N \g__mcrule_pattern_after_int
270   \int_gset:Nn \g__mcrule_pattern_for_int {-1}
271 }
```

__mcrule_set_pattern:n

Set the keys an individual pattern. To avoid potential recursion and loops, we filter out the key 'pattern' when it appears in a pattern definition.

```
272 \cs_new_protected:Npn \__mcrule_set_pattern:n #1
273 {
     \prop_get:NnNTF \g__mcrule_patterns_prop {#1} \l_tmpa_tl
274
    {
       \keys_set_filter:nnV {mcrule} {patterns} \l_tmpa_tl
    }
278
    {
       \msg_error:nnn {multicolrule} {pattern-undefined} {#1}
279
280
     \tl_set:Nn \l_tmpa_tl {\prop_item:Nn \g_mcrule_patterns_prop {#1}}
281
282 }
283 \cs_generate_variant:Nn \__mcrule_set_pattern:n {V}
```

4.6 Key-Values

Set up all the key definitions. For the line styles, this involves resetting __mcrule_divider: to an appropriate value.

```
284 \keys define:nn {mcrule}
285 {
                          extend-top
                                                                                                                                                                                                                           .dim_set:N = \l__mcrule_extend_top_dim,
286
                          extend-bot
                                                                                                                                                                                                                           .dim_set:N = \l__mcrule_extend_bot_dim,
                         extend-fill
                                                                                                                                                                                                                           .bool_set:N = \l__mcrule_extend_fill_bool,
                                                                                                                                                                                                                           .default:n = true,
                         extend-fill
                         extend-reserve
                                                                                                                                                                                                                .dim_set:N = \l__mcrule_extend_reserve_dim,
                          line-style
                                                                                                                                                                                                                           .choice:,
                                                                                                                                                                                                                           .code:n = \cs_set:Npn \ \clim{thm} \_mcrule\_divider:
                         line-style / default
                                       {\vrule\@width\columnseprule},
                          line-style / solid
                                                                                                                                                                                                                           .code:n = \cs_set:Npn \__mcrule_divider:
                                      {\__mcrule_solid_line:},

4.7 User Interface

\SetMCRule Set all keys for multicolrule

```
\SetMCRule \{\langle key\text{-}value\ list\rangle\}
```

All we do here is pass the argument to expl3's key-setting routine.

```
383 \NewDocumentCommand{\SetMCRule}{m}
384 {
385 \keys_set:nn {mcrule} {#1}
386 }
```

(End definition for \SetMCRule. This function is documented on page ??.)

\DeclareMCRulePattern

Declare a new style pattern.

```
\verb|\DeclareMCRule| \{\langle name \rangle\}| \{\langle key\text{-}value| list \rangle\}|
```

If a pattern of that name exists, it will be overwritten silently.

```
387 \NewDocumentCommand{\DeclareMCRulePattern} {m m}
388 {
389 \prop_gput:Nnn \g__mcrule_patterns_prop {#1} {#2}
390 }
```

(End definition for \DeclareMCRulePattern. This function is documented on page ??.) </package>
